

# Margaret Hamilton

## THE WOMAN WHO LANDED MAN ON THE MOON.

In a small village in the heart of Indiana, a pretty little girl named Margaret was born on August 17, 1936.

Endowed with a remarkable assiduity, she ended up becoming passionate about mathematics at the end of her schooling.

That's why she studied math at the University of Michigan before obtaining her bachelor's degree in 1958. However, she developed a passion for programming, so she joined MIT in 60'.

She works on the military project SAGE for 2 years which is the beginning of her incredible adventure.

It is in the Draper laboratory that she works for NASA's Apollo program missions on the software responsible for landing spaceships on the Moon.

This director of the software engineering department is a real example given her achievements in a very male field. As the mother of a little girl, she had to face criticism from people who did not understand how a mother could have such a professional career.

She is a very important figure in the scientific community and encourages little girls to follow her path and affirm themselves in a field where they are not sufficiently represented.

"It's not subtle or restrained. It's not any of the things you like to think apply to your acting."
